

Notes

- 1) Resistors without power rating value are MRS25 0.6W
- 2) Derived from scrappy hand drawn schematic SOLD by Beard Audio which did not match actual build or have reference designators
- 3) LH Channel similar to RH with reference designators +100 except positions R5 and R7 which may both be marked R107?
- 4) V101 LH Channel has the triode section pins swapped 123 = 678 and vice versa and V105-V106-V107 = V7-V6-V5
- 5) New output transformers were wound by UK manufacturer and enabled removal of C3 and C5 with better overall performance
- 6) Input stage becomes a.c. coupled – R1 position is now a Capacitor and C1 a resistor for d.c. path of V1 - V101
- 7) Voltages shown in red are approximate and measured with high impedance meter – Some component changes marked in magenta
